They are also useful for the manufacture of a medicament for treating a syndrome associated with a human disease, specifically a Novx-associated disorder. They may also be useful in therapeutic applications including protein therapy, as small molecule drug targets, as antibody targets, as diagnostic and/or prognostic markers, in gene therapy, as research tools and in tissue research tools and in tissue research.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human; 88; Ulip; CRMP; collapsin response mediator protein; PCR; Unc-33-like protein; neurodegenerative disease; Alzheimer's disease; paraneoplastic neurodegenerative disease; PND; myelination; demyelination; remyelination; myelin disorder; multiple sclerosis; autoimmune neurodegenerative disorder; HTLV-1 associated myelopathy;

The NOVX polypeptide, nucleic acid and antibody of the invention are useful for treating or preventing a pathological condition in humans with a NOVX-associated disorder, e.g. Von Hippel-Lindau
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        human T lymphocyte virus 1; reverse proteolipid protein; PLP.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      research tools and in tissue regeneration. The present nucleic acid sequence represents a PCR primer that was used in the methods of the invention to amplify one of the 17 novel proteins of the invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              CC myelin disorders, comprises administering to a patient an effective (collapsin response mediator protein) protein, a nucleic acid coding for CC (collapsin response mediator protein) protein, a nucleic acid coding for CC (lip)(CRMP, an antisense sequence capable of specifically hybridising with CC the nucleic acid, an antibody directed against Ulip/CRMP, or an aptamer CC capable of binding ULIP/CRMP, and a pharmacologically acceptable carrier. CC Also included are methods of diagnosing a myelin disorder in a subject, cidentifying agents useful for the prevention or treatment of myelin CC disorders, using the Ulip/CRMP proteins/nucleic acids, agents capable of CC modulating the function or expression of the proteins (increasing or CC decreasing), and a method for identifying an endogenous agent as a CC therapeutic target for the prevention or the treatment of myelin CC disorders. The agents are useful for preventing or treating a myelin CC disorder such as multiple sclerosis or HTIV-1 (human T lymphocyte virus C lassociated myelopathy and neurodegenerative diseases, Alzheimer's C disease, paraneoplastic neurodegenerative diseases (PND), autoimmune C theorogenes of myelination. Asswering are involved in articles.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      theprocesses of myelination, demyelination and remyelination. Antibodies to a Ulip/CRMP protein are useful for diagnosting a myelin disorder. The present sequence is a reverse transcriptase (RT)-PCR primer for proteolipid protein (PLP, an oligodendrocytic marker protein) used as a control in an experiment to detect mRNA encoding Ulip proteins

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           CC molecular beacon comprising an oligonucleotide probe (see ABL57069)
CC covalently attached at the 3' end to fluorescent dye and at the 5' end to
CC a nanoparticle. In the native state, the probe forms a hairpin
CC conformation with hybridised termini. The proximity of the fluorophore
CC and quencher (gold nanoparticle) in the molecular beacon results in
CC little or no detectable fluorescence. Upon hybridisation of the central
CC complementary stretch of the probe to a target sequence, such as the
CC present sequence, the hairpin undergoes a conformational change resulting
CC in an increase in fluorescence, the extent of which is proportional to
CC the amount of target sequence present. Experiments with the present
CC sequence and a perfectly-matched target (see ABL57071) showed that
CC relates generally to the use of metal surface quenchers such as particles
CC relates for high sensitivity applications in, for example, detection and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Matches

FFX8X333333333333333X8 layer applied on support, spotting oligonuclectide solution having one of its ends bonded to hydrophobic group on layer and solidifying layer.

Example 1; Page 12; 32pp; English

The invention relates to a method for attaching oligonucleotide to a solid support and an oligonucleotide array. The oligonucleotide array is prepared by applying hydrophobic attachment layer onto a support which can be solidified under certain conditions, spotting certain portions of said attachment layer with aqueous oligonucleotide solution in which hydrophobic groups are bonded to 3' or 5' terminals and solidifying said attachment layer. The method is useful for attaching a oligonucleotide (preferably a PCR amplified product from a PCR with its 5' terminal bonded to a hydrophobic group) onto support. The method is useful in the area of genetic diagnosis and analysis, and DNA chips which are based on hybridisation. The present sequence is fluorescent oligonucleotide useful in hybridisation. hybridisation. The in hybridisation

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   RESULT 3140
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       CC expression, mutation or underexpression, which may be used in diagnosing CC and/or treating the disorders. The nucleic acid molecules comprising the CC polymorphic sequences contained in CYP4501A1, CYP94501A2, CYP4502E1, CC ARNY, EPHX2, GST12, NNWY, NQO2, NR112, STM, UGT2B3, UGT2B3, UGT2B15, AHR, CMDR1 and/or MDR3 are useful for screening individuals for altered drug CC metabolism. The polymorphic sequences contained in CYP4501A1, CYP94501A2, CRHR, MDR1 and/or MDR3 may also be used to screen individuals for CC susceptibility to cancer. Polymorphic sequences in ADRB1 or CHMR2 are CC used to screen for altered cardiovascular function, in CA2 for altered contral convolus system function, in FLAP and HNMT for altered derine CC immunological or haematological function, in LTP for altered immunological or haematological function, in CHMR3, CHMR4 or CHMR5 for altered central and CC immunological function, in CHMR3, CHMR4 or CHMR5 for altered central and CC peripheral nervous system function. The present sequence represents a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 CC cytochrome P450 0221 (CYP4500221), adrenergic receptor betal (ADBRI), CC cytochrome P450 0221 (CYP4500221), adrenergic receptor betal (ADBRI), CC (ARWT), cathepsin S (CTSS), cyclooxgenase 2 (COX2), diazepam binding CC inhibitor (DBI), epoxide hydroxylase 2 (EPH22), 5-lipoxygenase activating CC protein (FLAP), glutathione-S-transferase 12 (GST12), histamine-N-methyl CC transferase (HNWT), (kallikrein 2) KLKz, nicotinamide -N-methyl CC transferase (NNWT), NADPH quinone oxidoreductase 2 (NQO2), cultotransferase thermolabile (STM), UDP-glucuronosyl transferase 2B4 (UGT2B4), UDP-glucuronosyl transferase 2B4 (UGT2B4), UDP-glucuronosyl transferase 2B4 (CYP3B15), urokinase receptor (uPA), multidrug resistance 1 (CMRR), clarase receptor (NRII2), or acetylcholine muscarinic CC receptor 1, 2, 3, 4, or 5 (CHMR), CHMR3, CHMR4 or CTHR5) sequence. CC The polymorphisms in the human genes cited in the invention are useful as CC genetic linkage markers for locating and characterising the genes that CC are responsible for a specific traits within the genome and eventually CC identifying the genes responsible for a variety of disorder-related CC expression multiation or undergraphs with man be used in diagnosing CC expression or undergraphs or wariety of disorder-related CC expression multiation or undergraphs which may be used in diagnosing CC expression or undergraphs of the mass of the diagnosing constitutive
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Query Match

The method is simple and efficient for polymucleotide amplification, allowing easy identification of the presence of single nucleotide polymorphisms (SNP). The method is isothermal, produces a high degree of amplification in a short time, and since it uses primers hybridising to several different sequences on the template it is highly accurate, without the amplification of irrelevant sequences which is a problem in conventional methods. The present sequences which is a problem in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention describes a method for polynucleotide synthesis by loop-mediated isothermal amplification, (LAMP). The method comprises: (a) identifying a target sequence on the template and a set of primers (inner and outer primer) hybridised to it and annealed to form a single-stranded polynucleotide with a loop at each end, followed by self-primed strand displacement complementary chain synthesis to form a two-stranded polynucleotide with a loop at each end, followed by self-primed strand displacement complementary chain synthesis to form a two-stranded polynucleotide having a loop of the lamburge of the l
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                28 MAR - 2002
                                                                                                                                                                                                                                                                                                                                                                                                         Sequence 21
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Example 4; Page 68; 135pp; Japanese
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Rapid isothermal polynucleotide synthesis using loop-mediated amplification for simple detection of single nucleotide polymorphisms.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  WO200224902-A1

                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention relates to coding sequences for NOV proteins (ABN85378-ABN85403 and ABB98401-ABB98424). The NOV proteins and coding sequences are useful for treating or preventing NOV-associated disorders or in the manufacture of a medicament for treating the disorders, such as cancer, heart disease, inflammation, autoimmune disorders, allergies, blood disorders, AIDS, diabetes, obesity, asthma, IgA nephropathy, cirrhosis, arthritis, Alzheimer's disease, infections (e.g. bacterial, viral, parasitic), stroke, muscular dystrophy, epilepsy, and other wasting disorders associated with chronic diseases. The present sequence is a PCR primer for a NOV coding sequence, which was used in an example from the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     10-JAN-2001;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention relates to a method for detecting a base at a pre-
CC determined position in a nucleic acid molecule. The method comprises
CC performing primer extension reactions using base-specific detection
CC primers, each being specific for a particular base at the predetermined
CC position. The allele-specific (AS) primer extension assay method of the
CC invention is useful for detecting an allele-specific base at a pre-
CC determined position in a nucleic acid molecule, for high throughput
CC single nucleotide polymorphism (SNP) analysis, and for detecting
CC mutations and genetic variations. The new method solves the deficiencies
CC of previous methods by providing a method of allele-specific extension
CC that allows accurate discrimination between matched and mismatched
CC configurations, as well as reducing or eliminating false positive results
CC observed in prior art. The use of two allele-specific primers increases
CC the sensitivity by a factor of two because signals of two extensions are
CC obtained. The present sequence represents a primer used in the examples
                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Query Match

The new method solves the deficiencies of previous methods by providing a method of allele-specific extension that allows accurate discrimination between matched and mismatched configurations, as well as reducing or eliminating false positive results observed in prior art. The use of two allele-specific primers increases the sensitivity by a factor of two because signals of two extensions are obtained. The present sequence represents a primer used in the examples
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention relates to a method for detecting a base at a predetermined position in a nucleic acid molecule. The method comprises performing primer extension reactions using base-specific detection primers, each being specific for a particular base at the predetermined position. The allele-specific (AS) primer extension assay method of the invention is useful for detecting an allele-specific base at a pre-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Detecting a base at a pre-determined position in a nucleic acid molecule, comprises performing primer extension reactions using base-specific detection primers in the presence of a nucleotide-degrading enzyme.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             07-FEB-2002; 2002US-00071926

Ras proteins are membrane bour GTpases. The nucleotide sequences are useful as targets for screeni drugs e.g. anticancer drugs, that can alter Ras signalling and the physiological effects of Ras on cell growth, differentiation and proliferation. The present sequence represents the Caenorhabditis e

The invention relates to an isolated nucleic acid molecule encoding a protein-coupled receptor HGPRBNY26. The nucleotide sequence comprises sequential nucleotide deletions from either the C-terminus or the N-terminus. Also included are an isolated polypeptide encoded by the nucleic acid, a recombinant vector comprising the nucleic acid, making recombinant host cell comprising the nucleic acid, diagnosing a
                                                                                                                                                                                                                                                                                                                                             07-MAR-2001;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention provides the protein and coding sequences of four novel human G-protein coupled receptors (GPCR) which are amplified in breast cancers. The sequences are useful in the treatment of cancers, including breast and prostate cancers. The present sequence is a PCR primer used to isolate a coding sequence for a GPCR of the invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         0
```

length of 0-nucleotide to 5-nucle genetic and/or therapeutic tools of a target gene.

for interfering

a 3' or 5' overhang each strand, useful fering or inhibiting

having expression

New RNA comprising double stranded RNA and length of 0-nucleotide to 5-nucleotides on

Claim 71; SEQ ID

ğ

277; 176pp; English

the response of cells to treatment with a compound that modulates protein cyrosine kinase activity or members of the protein tyrosine kinase compound is capable of compathway. Also described: (1) predicting whether a compound is capable of compathway. Also described: (1) predicting whether a compound is capable of compathway. Also described: (2) predicting whether a compound is capable of compathway. Also described: (2) predicting obtaining a sample of cells, (2) determining a sample of cells, and (2) dentifying polynucleotides and polypeptides whose expression levels (2) correlate with compound sensitivity or resistance of cells associated with a disease state, comprising subjecting the plurality of cell lines to one or more compounds, analysing the expression pattern of a microarray of polynucleotides or polypeptides, and selecting (2) polynucleotides or polypeptides, and selecting (2) polynucleotides or polypeptides that predict the sensitivity or cells associated with a disease state by using the compounds that interact with protein tyrosine therapy. The polynucleotides and polypeptides are useful in predicting the cativity of compounds that interact with protein tyrosine kinases and/or protein tyrosine kinase pathways. These may be used in determining drug sensitivity in patients to allow the development of individualized cancer) based on patient response at a molecular level. The present of cancer) based on patient response at a molecular level. The present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            S

The present invention describes a predictor set comprising a plurality of coplynucleotides or polypeptides whose expression pattern is predictive of the response of cells to treatment with a compound that modulates protein cyrosine kinase activity or members of the protein tyrosine kinase compound that modulates protein tyrosine kinase expression of the markers of the protein tyrosine kinase creativity of cells, comprising obtaining a sample of cells, compound is capable of modulating the activity of cells, comprising obtaining a sample of cells, compound that mind a sample of cells, compound that the compound is capable of certaining whether the cells, comprising obtaining a sample of cells, compound that in the compound that the compound that the compound sensitivity of cell lines for correlate with compound sensitivity or resistance of cells associated with a disease state, comprising subjecting the plurality of cell lines to one or more compounds, analysing the expression pattern of cell lines to one or more compounds, analysing the expression pattern of cell lines to one or more compounds, analysing the expression pattern of cell lines to one or more compounds, analysing the expression pattern of cell lines to one or more compounds, analysing the expression pattern of cell lines to one or more compounds, analysing the expression pattern of cell lines to one or more compounds, analysing the expression pattern of cell lines to one or more compounds, analysing the expression pattern of cell lines to one or more compounds, analysing the expression pattern of cell lines or polypeptides, and selecting the compound that predict the sensitivity or resistance of cells associated with a disease state by using the capacity of compounds that interact with protein tyrosine kinases and/or genetic profiles which aid in treating diseases and disorders (e.g. cancer) based on patient response at a molecular level. The present invention.

Also described: (1) modulating expression of SCD genes in cells, tissue explants or organisms by introduction of siNA; (2) kits for in vitro or in vivo delivery of siNA; (3) conjugates and/or complexes of siNA, and (4) vectors that express siNA. SCD inhibiting siNAs have anorectic, antidiabetic, antiarteriosclerotic, cytostatic and virucide activities. The siNAs can be used to modulate expression of SCD genes, in cells, tissue explants or organisms, e.g. for treating obsestly; diabetes (types I and II); atherosclerosis; cancer and viral infections. They can also be used for drug screening; diagnosis; target identification and validation; genetic engineering; pharmacogenomics; atherosca function and validation; genetic engineering; pharmacogenomics;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      (RIBO-) RIBOZYME PHARM
                                                                                                                                                                     Sequence 21
                                                                                                                                                                                                                    studying gene function and gene mapping (e.g. of single-nucleotide polymorphisms). The present sequence represents an SCD siNA, which used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New short interfering nucleic acid, useful e.g. diagnosis of obesity or diabetes, downregulates stearoyl-CoA desaturase gene.

Characteristic protective, nootropic, antiparkinsonian, and antilipaemic activity.

Characteristic protective, nootropic, antiparkinsonian, and antilipaemic activity.

Characteristic protection as a vaccine. A polypeptide of the invention is considered with the manufacture of a medicament for treating a syndrome associated with the polypeptide. These manufacts are apathology consisted with the polypeptide. These manufacts such as cardiomyopathy, creating or preventing NOVY-associated disorders such as cardiomyopathy, catheroscierosis, hypertension, scleroderma, obesity, cancer, diabetes, canternoscial, graft-versus-host disease, AIDS, asthma, Crohn's disease, comultiple sclerosis, infections, anorexia, cancer-associated cachexia, neurodegenerative disorders (e.g. Alzheimer's disease or Parkinson's concerdes associated with chronic diseases. The nucleic acids are also cused as hybridisation probes, in chromosome mapping, tissue typing, preventive medicine, and pharmacogenomics. The polypeptides are also concerdes associated with chromic diseases.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          This oligonucleotide comprises the 5' acceptor site of intron 1 of the human Huntington's disease (HD) gene. The splice site sequences for the first 5 exons of the mouse HD gene (see AAT78974) and the human HD gene were compared (see AAT7895-T79002). Targeted disruption of the murine HD gene, e.g. at exon 5, can be used to examine the function of the HD gene and its role in development. Transgenic mice can be used as models of HD

Typing HLA-A, -B or -C class 1 genes comprises providing a sample DNA containing a HLA-A, -B or -C class 1 gene having a 1st and 2nd exon and a target sequence, contacting the sample DNA with an amplification primer including sequence complementary to sequence located in exon 1 of the HLA-A, -B or -C gene, and a second amplification primer sequence complementary to sequence located in exon 5 of the HLA-A, -B or -C gene. The PCR product is sequenced using the above primers and the determined DNA sequence compared with the DNA sequences of known HLA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human
locus
The present sequencing primer was used leukocyte antigen (HLA) class I genes.
                                                                                                                                                                                                                                                                                                                                                                                                                         WO9731126-A1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Primer for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Sequencing primers AAT94987-92 were used to sequence PCR amplified hum leukocyte antigen (HLA) class I genes. The primers are designed to hybridise to exon-intron borders of exons 2, 3 and 4 of the HLA genes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Amplification and sequencing primers useful for locus specific nucleic aci

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        the sense strand of exon 4, from the 5' exon-intron border. PCR primers were used for locus specific nucleic acid amplification for HLA typing. Typing HLA-A, -B or -C class 1 genes comprises providing a sample DNA containing a HLA-A, -B or -C class 1 gene having a lst and 2nd exon and target sequence, contacting the sample DNA with an amplification primer including sequence complementary to sequence located in exon 1 of the HLA-A, -B or -C gene, and a second amplification primer sequence complementary to sequence so of the HLA-A, -B or -C gene. The PCR product is sequenced using the above primers and the determined DNA sequence compared with the DNA sequences of known HLA types
                                        The specification describes termamyl-like alpha-amylase variants that have altered amino acid sequences to improve properties. The variants are produced by creating one or more of the following mutations in amino acid sequence of the parent termamyl-like alpha-amylase: T141, K142, F143, B144, F145, F146, G147, R148, G149, Q174, R181, G182, D183, G184, K185, A186, W189, S130, N195, H107, K108, G109, D166, W167, D168, Q169, S170, R171, Q172, F173, F267, W268, K269, W270, D271, L272, G273, A274, L275, K311, E346, K385, G456, N457, K458, P459, G460, T461, V462, T463. The variants can be used for washing and/or dishwashing. They can also be used in the production of sweeteners and ethanol from starch, and/or textile desizing, and in starch liquefaction and/or saccharification processes. The present PCR primer was used to construct the variants of
                                                                                                                                                                                                                                                                                                                             WPI; 1999-326987/27.

The HLA class I genes are found on chromosome 6p21.3. HLA class I proteins are found on the surface of almost all nucleated cells and are involved in antigen presentation to immune system cells. This primer can be used to type HLA class I genes by carrying out PCR on a sample DNA, comprising HLA class I gene, and detecting the amplicon formed using a sequence-specific detection method e.g. DNA sequencing (using the present sequence). The present sequence is useful for discriminating among the HLA-A, HLA-B, and HLA-C genes and other related class I genes and pseudogenes. In addition, the present sequence is useful for organ transplantation studies, for the study of autoimmune disease and for the determination of susceptibility to infectious disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Typing HLA class I genes for organ transplantation, involves contacting the sample DNA containing HLA class I gene comprising two exons and a target sequence, with amplification primers and detecting the amplicon.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human Leukocyte Antigen class I; HLA-\lambda; antigen presentation; organ transplantation; autoimmune disease; sequencing primer; infectious disease susceptibility; chromosome 6p21.3; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present sequence is a sequencing primer for Human Leukocyte Antigen (HHA) class I gene. The HLA class I genes are found on chromosome 6p21.3. HLA class I genes are found on chromosome 6p21.3. HLA class I proteins are found on the surface of almost all nucleated cells and are involved in antigen presentation to immune system cells. This primer can be used to type HLA class I genes by carrying out PCR on a sample DNA, comprising HLA class I gene, and detecting the amplicon formed using a sequence-specific detection method e.g. DNA sequencing (using the present sequence). The present sequence is useful for discriminating among the HLA-A, HLA-B, and HLA-C genes and other related class I genes and pseudogenes. In addition, the present sequence is useful for organ transplantation studies, for the study of autoimmune disease and for the determination of susceptibility to infectious disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Mahogany gene; mouse; mg gene; regulatory defect; gene therapy; obesity; weight regulation; cell therapy; body weight disorder; cachexia; anorexia; hyperpigentation; increased metabolic rate disorder; hyperphagia; Antiobesity; antianorexic; anticachexic; PCR primer; ss.
New human and murine mahogany genes, useful, e.g. for diagnosis

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           (cell-based) gene therapy. (II) are used to raise specific antibodies (Ab); to identify other (extra)cellular products involved in weight regulation, and to screen for agents that disrupt interaction between (II) and other macromolecules. The Ab are used to detect abnormal levels (or function) of (II) (for diagnosis, prognosis or monitoring of treatment); to evaluate (II)-expressing cells intended for cell therapy, and as therapeutic mg inhibitors. Cells that express the mg gene (or contain the mg polypeptide) are used to identify agents (A) that modulate mg activity. (A) are potentially useful for the treatment of body weight disorders, particularly obseity, cachexia or anorexia, or other conditions associated with the mg gene such as hyperpigmentation,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      invention. The mahogany genes are used: (i) to produce recombinant mahogany (mg) proteins (II); (ii) as a source of antisense, ribozyme o triplex-forming therapeutics; (iii) as a source of diagnostic probes a primers for detecting expression of mg genes or mutations, regulatory defects, in this gene, or for isolation of related sequences; and (iv)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention describes an isolated antibody that binds to one of the human PRO proteins designated PRO212, PRO290, PRO314, PRO535, PRO619, PRO1017, PRO809, PRO3107, PRO1005, PRO1005, PRO1005, PRO1025, PRO1030, PRO1097, PRO1107, PRO1111, PRO1153, PRO1105, PRO11087, PRO11097, PRO1107, PRO1111, PRO1151, PRO1153, PRO1184, PRO1187, PRO1181, PRO2139, PRO39, PRO834, PRO1117, PRO1151, PRO2094, PRO2145 OR PRO2198. PRO antagonists can be used to inhibit tumour cell growth. The CC PRO1281, PRO23, PRO39, PRO834, PRO1117, PRO1710, PRO2094, PRO2145 OR PRO2198. PRO antagonists can be used to inhibit tumour cell growth. The CC PRO polypeptides and nucleotides are useful in the treatment, diagnosis and prevention of cancer. The antibodies and other anti-tumour compounds cand prevention and/or activation of the amplified PRO genes. Exemplary CC conditions or disorders to be treated with such antibodies and other CC compounds include benign or malignant tumours (e.g., renal, liver, CC kidney, bladder, breast, gastric, ovarrian, colorectal, prostate, pancreatic, lung, vulva, thyroid, hepatic carcinomas, sarcomas, CC pancreatic, lung, vulva, thyroid, hepatic carcinomas, sarcomas, CC glioblastomas, and various head and neck tumours), leukaemias and CC lymphoid malignancies, other disorders such as neuronal, glial, CC stromal and blastocoelic disorders, and inflammatory, angiogenic and CC immunologic disorders. AAC58242 to AAC58366 represent PCR primers and CC myloridisation probes used in the isolation of the human PRO sequences.

CC polynucleotide and protein sequences given in the exemplification of the creation of the human PRO sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Matches

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to the use of a polypeptide (ABB4454-ABB44601, ABB44606-ABB44623) or its variant or encoding nucleic acid (ABA81990-ABA81995-ABA82032) with vulnerary and/or dermatological activity for the diagnosis, prevention and treatment of skin disorders and treatment in wound healing or for the identification of pharmacologically active substances. The nucleic acids are useful in gene therapy. The present sequence is that of a PCR primer, useful to the invention. Note: The printed sequence listing for this specification was incomplete, terminating part way through SEQ ID NO 106. The remaining data was obtained from EPO data for an equivalent patent (EP1114862)
The present invention relates to a kit and method for the detection of gene polymorphisms of drug-metabolising enzyme genes. The kit contains a polymerase chain reaction (PCR) buffer solution containing DNA polymerase and NTP, a normal forward primer, a mutated forward primer, a reverse primer and a fluorescence-labelling probe. The method involves carrying out PCR on sample DNA, containing a drug-metabolising enzyme gene, together with PCR buffer, the normal forward primer, the reverse primer and the fluorescence-labelling probe (step A); and carrying out PCR on the sample DNA together with PCR buffer, the mutated forward primer, the

                                                                                                                                                                                                                                 The present sequence represents a primer used to produce maize cDNA. specification describes plant androgenesis markers, which are derived from maize. Maize androgenesis markers are used to evaluate the androgenic potential of plants and derived cultures of microspores. I markers are also used to clone genes involved in androgenesis, and for genetic analysis to identify quantitative trait loci involved in androgenesis, particularly in cereals, specifically maize. Varieties capable of androgenesis are useful in plant breeding programs
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New markers for plant androgenesis, useful for evaluating androgenic potential, cloning of androgenesis genes and genetic analysis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   14-MAR-2000; 2000FR-00003245

Sequences AAH37205 - AAH40944 represent PCR primers, single nucleotide CC primer extension (SNPE) primers, and the sequences of regions flanking CC sites of single nucleotide polymorphisms SNPs. The present invention CC includes kits for determining the presence or absence of a SNP, using the CC oligonucleotides of the invention. The PCR primers are used to amplify a CC SNP Ilanking sequence, the SNPE primer is used as a genotyping primer. CC The oligonucleotides are useful for genotyping a nucleic acid sample by CC performing a single-nucleotide primer extension reaction. The CC oligonucleotides are useful for determining the presence, absence or CC identity of a SNP and for genotyping nucleic acid sample by CC assess by association analysis the genotype of an individual or group of CC individuals, having a pathological phenotypic trait suspected of being CC auged by one or more SNPs, Phenotypic traits include diseases e.g. CC osteogenesis imperfects and acute intermittent porphyria, Phenotypic CC traits also include symptoms of or susceptibility to multifactorial CC disease of which a component is or may be genetic such as autoimune CC disease of which a component is or may be genetic such as autoimune CC inflammation, cancer, nervous system diseases and infection by pathogenic microorganism. The method is also useful in forensic investigations and content in the present semence represents a DCD primer specific.

The present invention concludes kits for determining the presence or absence of a SNP, using the cligonucleotides of the invention. The PCR primers are used to amplify a component of the concludes of the invention. The PCR primers are used to amplify a component of the concludes are useful for genotyping a nucleic acid sample by performing a single-nucleotide primer extension reaction. The coligonucleotides are useful for determining the presence, absence or conditionable of a SNP and for genotyping nucleic acid sample by conditionable of a SNP and for genotyping nucleic acid sample by conditionable of a SNP and for genotyping nucleic acid samples, for e.g. to casees by association analysis the genotype of an individual or group of conditionable, having a pathological phenotypic trait suspected of being caused by one or more SNPs. Phenotypic trait suspected of being cagement by the presents include diseases e.g. consteogenesis imperfects and acute intermittent porphyria. Phenotypic traits also include symptoms of or susceptibility to multifactorial constants also include symptoms of or susceptibility to multifactorial confidences, including, rheumatoid arthritis, multiple sclerosis, concert, nervous system diseases and infection by pathogenic microorganism. The method is also useful in forensic investigations and concert, nervous system diseases and infection by pathogenic concert, and susceptibility to multifactorial accordance of the present sequence represents a PCR primer specific concert, and susceptibility to constitutions and paternity analysis. The present sequence represents a PCR primer specific for a human SNP containing DNA sequence

CC check whether they are susceptible to toxins or resistant to certain CC check whether they are susceptible to toxins or resistant to certain CC damage, skin cancer and cancers associated with oxidative stress. The CC method allows the characterisation and mechanism of the GST1 deletion CC and identifies 18 kb homology regions flanking GSTT1 which are involved CC in the deletion event that produced the *0 allele. The method permits the CC unambiguous discrimination of all GST1 genotypes (*A), *0/0 (both CC homozygous), *A/0 (heterozygous)). The technique allows the reproducible CC simultaneous discrimination of all GST1 genotypes (*A), *0/0 (both CC enzyme activity in erythrocytes. The trimodular distribution of CC entrypes detected by these procedure correlated highly significant with CC phenotypes at high, intermediate and null- activity in homo- and CC indicate a gene dose effect. The present sequence is a PCR primer for CC amplifying a 3187bp fragment from the human GSTT1*0 allele
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           RESULT 3168

The invention relates to novel isolated G-protein coupled receptor (GPCR) CC polypeptides and polynucleotides. The GPCR polypeptide, GPCR nucleic acid cand antibody are useful for treating, preventing or alleviating a GPCR-CC associated disorder or a pathological state in a subject, particularly a human. In particular, the disorder is cardiomyopathy, atherosclerosis, CC diabetes, or a disorder related to cell signal processing and metabolic control of the presence of or predisposition to a disease associated control of the presence of or predisposition to a disease associated control of the presence of or predisposition to a disease associated control of the presence of or predisposition to a disease associated control of the presence of or predisposition to a disease associated control of the presence of or predisposition to a disease associated control of the presence of or predisposition to a disease associated control of the presence of or predisposition or prophylactic acid and polypeptide are especially useful in therapeutic or prophylactic control of the protein associated with aberrant GPCR expression or control of the protein is useful in gene therapy for control of the protein is useful in gene therapy for control of the protein of the nucleic acids and control of the protein of the nucleic acids and control of the protein of the nucleic acids and control of the protein of the nucleic acids and control of the protein of the nucleic acids and control of the protein of the nucleic acids and control of the protein of the nucleic acids and control of the protein of the nucleic acids and control of the protein of the nucleic acids and control of the protein of the pro

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           . Sequence
                                                                                                                           The present invention relates to a method for detecting non-responders t anti-tumour necrosis factor (TNF) therapy. The method involves testing a individual for homozygosity for at least one single nucleotide polymorphism (SNP) in the gene coding for TNF receptor II, which is located on chromosome 1p36. Two novel SNPs, one in exon 2 (position 168 A/G) and one in exon 6 (position 587 T/G) which result in Lys56Lys and Met196Arg respectively, are also described. The method of the invention is useful for detecting non-responders to anti-TNF therapy such as inflixingly therapy, or therapy such as the interaction of the invention is useful for detecting non-responders to anti-TNF therapy such as inflixingly therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human;

                                                                                                                               The invention relates to an isolated beta-related protein (BRP) a novel glycoprotein hormone, its fragment, derivative, analogue, homologue or comaturally occurring allelic variant and the nucleic acid encoding it.

CC Also disclosed are novel alpha related proteins (ARP) and their nucleic caids. Also included are a nucleic acid vector comprising BRP, a host cell comprising the vector, a protein multimer comprising BRP, a host composition, and a second polypeptide, an antibody that selectively binds to BRP or the multimer, screening for a modulator of activity, or of clatency or predisposition to a reproductive disorder comprising CC administering a test compound to an animal at risk from a pathology associated with BRP, where the animal recombinantly expresses an ARP/BRP collective disorder in a subject by measuring the amount of an ARP/BRP polypeptide, measuring the presence of, or predisposition to, a control level, determining the presence of, or predisposition to, a concleic acid in a sample and comparing it to a control and expressing an ARP/BRP protectins, nucleic acids, antibodies and multimers are useful for treating, preventing or diagnosing reproductive and cell proliferative classred including ovulatory diseases, fertility related disorders, they are also useful for stimulating spermatogenesis, increasing the cutous of the thyroid glandular cells, regulating gonadal function, ce function of the thyroid glandular cells, resulating or suppressing certifities, reperfusion or regeneration and treatment of lung or liver fibrosis, reperfusion injury in various tissues and conditions resulting cutous cutous tissues and conditions resulting cutous care disperse and conditions resulting cutous cutous tissues and conditions resulting cutous care in a care and conditions resulting cutous cutous cutous tissues and conditions resulting cutous care in a care and conditions resulting cutous care and condi
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Alpha related protein; Beta related protein; ARP; BRP; hypothyroidism; glycoprotein hormone; reproductive disorder; cell proliferative disorder ovulatory disease; fertility related disorder; metabolic disorder; pituitary disorder; spermatogenesis; lung fibrosis; liver fibrosis; reperfusion injury; systemic cytokine damage; inflammatory condition; septic shock; sepsis; systemic inflammatory response syndrome; SIRS; ischaemia; endotoxin lethality; arthritis; nephritis; Crohn's disease; complement-mediated hyperzecute rejection; chemokine-induced lung injury; inflammatory bowel disease; anaphylaxis; hypersensitivity; ss; probe;

        This invention relates to the cDNA and protein sequences of novel proteins HYPLIP1 or FCHIL and to sequence variations within these genes that have been shown to be associated with lipid disorders.

Oligonuclectide probes that hybridise to the cDNA sequence are useful for analysing the expression of FCHIL1 by detecting the expression of the mRNA transcript in the sample. A host cell transformed with the cDNA of the invention is useful for producing the protein by recombinant means. Pharmaceutical compositions based on the sequences of the invention are useful for treating or preventing a lipid disorder associated with expression of FCHIL such as familial combined hyperlipidaemia, coronary artery disease, atherogenic lipoprotein phenotype, hyperapobetalipoproteinaemia, hypertriglyceridaemia, familial variational displantation and dyslipidaemia hypertension, syndrome X, obesity, insulin resistance and hyperchalters of the country of the co
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Bodnar JS,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            (such as septic shock, sepsis or systemic inflammatory response syndrome (SIRS)) ischaemia-reperfusion injury, endotoxin lethality, arthritis, complement-mediated hyperacute rejection, nephritis, cytokine or chemokine-induced lung injury, inflammatory bowel disease, Crohn's disease, anaphylaxis and hypersensitivity, and disorders resulting from over production of cytokines. The present sequence is an ARP or BRP over production of cytokines.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                Novel HYPLIP1 and FCHL1 genes and their sequence variations associated with lipid disorder and cancer, useful for prognosis, diagnosis and

New isolated human G-protein coupled receptor x (GPCRX) polypeptide, useful for treating or preventing GPCRX-associated disorders e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          prognosis of predisposition to lipid disorders and cancers, and also identify a molecule which enhances or decreases the HYPLIP1 or FCHLI activity. The present sequence represents an oligonucleotide primer specific for the mouse HYPLIP1 locus of the invention. The mouse HYP locus is situated on chromosome 3
                                                                                                  Smithson

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 £X&XSSSSSSSSSSSSSSSSSSSSSSSSSSSSS
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      cc mootropic, anti-HIV, antiasthmatic, antiarteriosclerotic, cytostatic, cc immunomodulator, antiinflammatory, antidabetic, anorectic, haemostatic, cc antibacterial, fungicide, protozoal, virucide, nephrotropic, osteopathic, cc cardiant, antiulcer, antiallergic, hepatotropic and antiparkinsonian cc activities, and can be used in vaccines and gene therapy. GPCR proteins, cmucleic acid molecules, and antibodies from the present invention can be used for manufacturing a medicament for treating or preventing a GPCR-cc associated disorder or syndrome related to cell signal processing and cmetabolic pathway modulation, such as cardiomyopathy, atherosclerosis, cc diabetes, cancer, obesity, infections (bacterial, fungal, protozoal or viral), HIV, asthma, Parkinson's disease, osteoporosis, Crohn's disease, culcers, allergies, cirrhosis, glomerulonephritis, stroke, systemic lupus erythematosus, or haematopoletic disorders. Anti-GPCR antibodies can be cused diagnostically to monitor protein levels in tissues as part of a clinical testing procedure such as in determining the efficacy of a given treatment regimen. Abg08418 to Abg08639 represent PCR primers and probes cc for the human GPCRs of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Matches

The method comprises: (i) selecting risk-associated reference nucleic acid sequences, including their functionally characterizing CC mutations; (ii) applying probes from these sequences, or their CC complements, to a carrier; (iii) hybridising the probes with a nucleic acid from for synthesised from) a patient sample; and (iv) detecting and CC evaluating the hybridisation pattern. The method provides a quick, CC inexpensive and informative diagnosis, and makes possible a CC multifactorial analysis for detecting e.g. synergism between different CC multifactorial analysis for detecting e.g. synergism between different CC multifactorial in presence of other mutations. The results may be combined CC with known risk-assessment methods to provide a more reliable diagnosis, CC especially important with new therapeutic methods (e.g. gene therapy) CC especially important because the provide a more reliable diagnosis, CC especially interested against specific genes. All relevant mutations in a CC reference sequence can be screened for in a single test and the method is well suited to automation. ABX09147-ABX09676 represent probes used to illustrate the method of the invarience.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        KW cytochrome P450 A2; CYP4501A2; cytochrome P450 CZE; CYP4502E1; LTF;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to an isolated polynucleotide comprising a sequence variation of a mouse HYPLIP1 CDNA or a human FCHL1 (familial combined hyperlipidaemia) gene. The FCHL1 polynucleotide, the FCHL1 polypeptide or antibody immunoreactive to the FCHL1 polypeptide are useful for treating or preventing cancer associated with expression of FCHL1, as well as for treating lipid disorder. The mouse HYPLIP1 CDNA or human FCHL1 gene are also useful for diagnosing or prognosing a predisposition to lipid disorder and cancer. ABK70902-ABK71303 represent mouse HYPLIP1, human FCHL1 coding sequences and PCR primers of the invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention relates to a new method of treating a patient at CC risk for systemic inflammatory response syndrome. The method involves CC administering a selective cyclooxyganase-2 inhibitor or a drug which CC stimulates at least one prostaglandin E 2 (PGE 2) receptor or a drug which interferes with binding of PGE 2 to at least one of PGE 2 complete the invention can be used for treating a patient at risk for cyclooxyganase syndrome e.g. sepsis, pancreatitis, burns, trauma, life threatening blood loss from penetrating injury, or a patient cyclooxyganase syndrome e.g. sepsis, pancreatitis, burns, trauma, life threatening blood loss from penetrating injury, or a patient cyclooxyganase shock, infections such as preumonia, cyclocamia, bactaeremia, urinary tract infection, wound infection or drug reaction and can also be used for beneficial immune modulation. The cyclocamia reduce the incidence of infectious complications and improve trauma, reduce the incidence of infectious complications and improve convival after traumatic injury. The present nucleic acid sequence crepresents the mouse cyclooxygenase-2 (COX-2) sense PCR primer that was used in the invention with the COX-2 antisense PCR primer (ABKI5347) for the isolation and determination of COX-2 mRNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Query Match

New NOVX polypeptides and nucleic acids, useful for diagnosing, preventing or treating NOVX-associated disorders, e.g. diabetes, obesity, cancer or dyslipidemia, and in chromosome mapping, tissue typing or pharmacogenomics.

Example C; Page 384; 586pp; English.

The present invention describes NOVX proteins, where X can be 1 to 55 CC (e.g. NOV1). Also described: (1) a composition comprising a polypeptide containers, the composition described above; (3) an isolated nucleic acid molecule which encodes a NOVX protein of the invention; (4) a vector CC comprising the nucleic acid molecule described above; (5) a cell comprising the above vector; (6) an antibody that immunospecifically comprising the polypeptide described above; (7) methods for determining the greence or amount of the above polypeptide or nucleic acid molecule in a CC sample; (8) methods for determining the presence of or predisposition to a disease associated with altered levels of expression of the above polypeptide or nucleic acid molecule in a first mammalian subject; (9) a CC method of identifying an agent that binds to the polypeptide described cor cuse in treating a pathology that is related to an aberrant expression or CC use in treating a pathology that is related to an aberrant expression or caberrant physiological interactions of the polypeptide; (11) a method of screening for a modulator of activity or of latency or predisposition to a pathology associated with the polypeptide; (12) a method for modulating the activity of the polypeptide described above; (13) methods of treating or preventing a pathology associated with the above polypeptide in a CC mammal; and (14) a method for producing the above polypeptide. NOVX

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             acid molecule may be used to diagnose, treat or prevent metabolic disorders such as diabetes or obesity, infections, cachexia, cancer, neurodegenerative disorders such as Alzheimer's disease or Parkinson's disease, immune disorders, haematopoietic disorders and various dyslipidaemias. The nucleic acids can also be used as hybridisation probes, in chromosome mapping, tissue typing, preventive medicine and pharmacogenomics. The present sequence represents a PCR primer for a human NOVX sequence, which is used in an example from the present
The present invention relates to the isolation of perennial ryegrass (Lollum perenne) nucleic acids and nucleic acid fragments encoding salt inducible or salt responsive proteins. The salt-inducible or salt responsive proteins include salt-inducible proteins (ESI3), glutathione peroxidase homologues (CSA), low-temperature-inducible proteins (LT16), salt-stress induced proteins (SALT), early salt-responding glucose 6
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   glutathione peroxidase homologue; low-temperature-inducible protein; salt-stress induced protein; SALT; WESRS; ALDP; plant tolerance; salt-stresponding glucose 6 phosphate 1 dehydrogenase; salt shock; plastidic fructose 1,6-biphosphate aldolase homologue; osmotic stress; environmental stress; sodium compartmentalisation; salt stress; pCR; sodium ion influx; sodium ion efflux; plant metabolism; primer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     05-OCT-2001; 2001AU-00008112
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          PCR primer

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      phosphate 1 dehydrogenase (WESRS), and plastidic fructose 1,6-biphosphate aldolase homologues (ALDP). The nucleic acids and nucleic acid fragments are useful as genetic markers. The nucleic acids, nucleic acid fragments, constructs, and vectors containing them are useful for modifying plant tolerance to environmental stress and/or osmotic stress, plant capacity to survive salt shock, compartmentalisation of sodium in a plant, sodium ion influx and/or efflux in a plant recovery after exposure to salt stress, or plant metabolism under salt stress. The present sequence represents a PCR primer used in the examples of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                             (BODN/)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       CC cDNA sequence, mouse HYPLIP1 genomic DNA, or the homologous human CC the sequence is associated with a lipid disorder. Also claimed is an CC isolated polypeptide comprising a variant form of the mouse HYPLIP1 amino CC acid sequence, or a variant form of a fully defined human FCHL1 amino CC acid sequence, where the variant is associated with the lipid disorder, CC an isolated polypucleotide having at least 12 contiguous nucleotides span CC the isolated polypucleotides, where the 12 contiguous nucleotides span the variation position, an isolated polypeptide comprising 4 contiguous amino acids of the encode polypeptides, where the 4 contiguous muleotides span CC lipid disorder which comprises comparing the nucleotide sequence, where CC suspected FCHL1 allele with a wild-type FCHL1 nucleotide sequence, where CC identifies a sequence variation of FCHL1 nucleotide sequence of the difference between the suspected allele and the wild-type sequence of carries an altered HyPLIP1 or FCHL1 lucleotide sequence and a carries an altered HyPLIP1 or FCHL1 gene function as an anti-CC anight disorder or anti-cancer therapy. The polymucleotides, polypeptides and antibody at the polymucleotides, polypeptides can antibodies are useful for treating or preventing (e.g. gene therapy) a lipid disorder associated with expression of FCHL1, for diagnosis or coronary artery disease, atherogenic lipoprotein phenotype, hypertoleases, atherogenic lipoprotein phenotype, coronary artery disease, atherogenic lipoprotein phenotype, and preventing to preventing the phenotype, hypertoleases and preventing to a preventing t
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Best Local Similarity Matches 16; Conserv
